Wind and Solar Energy Resources Modeling and Analysis

For Different Locations in the U.S.

Four U.S. Locations for Comparison of Renewable Energy Modeling and Analysis

Charlotte NC, Boston MA, Boulder CO, Tucson AZ.

Data are retrieved from NREL's Developer Network: <https://developer.nrel.gov/>

Wind Energy Resources Modeling

Charlotte, NC

Time series of wind speed at height 100m (m/s)

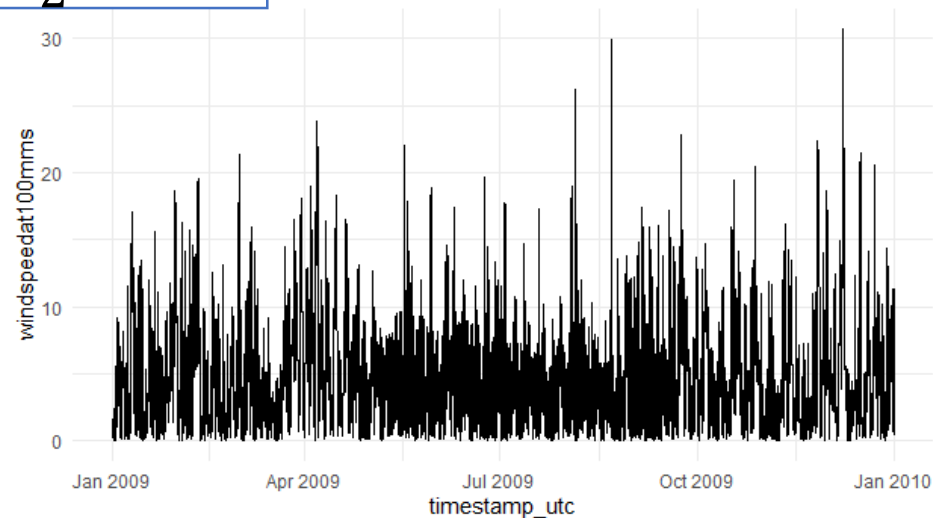

Boston, MA

$$P_w = \frac{1}{2} \rho A v^3$$

Boulder, CO

Tucson, AZ

Wind Energy Resources Modeling

Boxplots of monthly distribution of wind speed

Charlotte, NC

Boston, MA

Boulder, CO

Tucson, AZ

Wind Energy Resources Modeling

Wind Roses of Wind Speed

Charlotte, NC

Boston, MA

Distribution of wind direction and speed

Boulder, CO

Tucson, AZ

Wind Energy Resources Modeling

Charlotte, NC

Probability density distribution of wind speed

Boston, MA

Boulder, CO

Tucson, AZ

Wind Energy Resources Modeling

Wind turbine GE 1.5SLE 77m is utilized for modeling

Charlotte, NC

Boston, MA

The wind power curve for GE 1.5SLE 77m to covert the wind speed to wind power

$$P_w = \frac{1}{2} \rho A v^3$$

Boulder, CO

Tucson, AZ

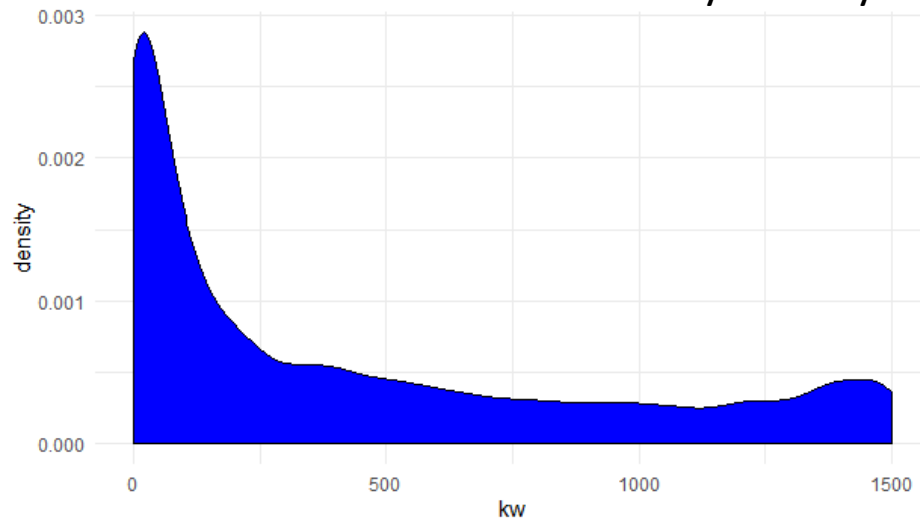

Wind Energy Resources Modeling

Probability density distribution of wind power

Charlotte, NC

Boston, MA

Considering other parameters such as air pressure, temperature and density at the given height=100m

$$P_w = \frac{1}{2} \rho A v^3$$

Tucson, AZ

Wind Energy Resources Modeling

Wind Energy Modeling in 2009

Calculating the net capacity factor (NCF)
for each month, then over the entire year

$$\text{NCF} = \frac{\text{The actual energy generated}}{\text{The possible maximum energy that could have been generated}}$$

$$\text{NCF} = \frac{\text{The actual energy (MWh)}}{\text{The capacity * time (MWh)}}$$

Charlotte, NC

Month	MWh	NCF
1	387.574	34.70%

Solar Energy Resources Modeling

Time series of Global Horizontal Solar Irradiance data (W/m^2)

Charlotte, NC

Boston, MA

Boulder, CO

Tucson, AZ

Solar Energy Resources Modeling

Boxplots of monthly distribution of Global Horizontal Solar Irradiance (GHI)

Charlotte, NC

Boston, MA

Boulder, CO

Tucson, AZ

Solar Energy Resources Modeling

Time series of components of solar irradiance, GHI, DNI, DHI (W/m^2)

GFS Solar Data for Charlotte

GFS Solar Data for Boston

GFS Solar Data for Boulder

GFS Solar Data for Tucson

Solar Energy Resources Modeling

Global Horizontal Irradiance (GHI) at the plane of array (POA)

Solar Energy Resources Modeling

Convert GHI at the POA to Solar PV Power

To convert the solar irradiance to solar PV power, besides the cloud cover and radiative transfer model, other parameters are considered, such as air temperature at the plane of array, module orientation and efficiency η_{mpp} .

$$P_{sol} \cong \eta_{mpp}(GHI_{POA}, T_m) GHI_{POA} * A$$

PV Module CS5P-220M

Manufacturer: Canadian Solar

Type: Polycrystalline Cells

Power: 220 W (Maximum)

Length: 63.1in (1,602mm)

Width: 41.8in (1,061mm)

Depth: 1.6in (40mm)

12	25576.46	15.65%

Solar Energy Resources Modeling

Calculating the total energy and net capacity factor, as it is done in the wind energy modeling
For 1 PV module (220W, **PV Module CS5P-220M**)

TMY	KWh	NCF
Charlotte	359.0896	18.63%
Boulder	385.341	19.99%
Boston	332.5404	17.26%
Tucson	438.1313	22.73%

TMY: Typical Meteorological Year, which means it assumes the same variability of solar output for other years.

Wind and Solar Energy Resources Modeling

Comparison of NCF for Resources of Wind & Solar Energy

2009	NCF	
	Wind Energy	Solar Energy
Charlotte	29.10%	18.63%
Boulder	24.90%	19.99%
Boston	41.40%	17.26%
Tucson	21.10%	22.73%

2010	NCF	
	Wind Energy	Solar Energy
Charlotte	27.00%	18.63%
Boulder	20.40%	19.99%
Boston	46.50%	17.26%
Tucson	22.60%	22.73%

Wind and Solar Energy Resources Modeling

Conclusion

The performance of wind and solar energy resources depends significantly on their location and weather conditions.

Further Work

Modeling and evaluate the wind and solar resources backed up by energy storage systems.
